2 SCOPE, PURPOSE AND METHODOLOGY

2.1

SCOPE

- This report covers the silicon wafer market and supply-chain for those wafers used in semiconductor device fabrication. The report contains data and analysis from TECHCET's data base and Sr. Analyst experience, as well as that developed from primary and secondary market research. For more information on TECHCET Critical materials Reports™ please go to <https://TEHCET.com>
- Silicon wafers are a critical in semiconductor manufacturing as most semiconductor devices are fabricated on silicon, thus silicon wafers are also the largest material spend of the semiconductor manufacturers.
- One of the challenges that the silicon wafer manufacturers encounter is profitability due to the timing of investments and industry downturns. Wafer pricing declined sharply from 2007 through 2016. The resulting rise and fall of profitability has led to a considerable consolidation in the market over the years, such that six manufacturers account for most of the wafer revenue and shipments. Despite this trend, new suppliers are emerging in the China market to support the "Made in China" program backed by the government. When these suppliers gain in capability and capacity, their influence could dramatically impact the silicon supply chain in the next 3+ years.

2.2

PURPOSE

- This Critical Materials Report™ (CMR) provides focused information for supply-chain managers, process integration and R&D directors, as well as business development managers, and financial analysts. The report covers information about key suppliers, issues/trends in the material supply chain, estimates on supplier market share, and forecast for the material segments.
